                                                                                                                                                                                                                                                                                                                                                                 Spinach debranching enzyme (DE) (R98371) is useful for modifying the branching degree of amylopectin synthesised in plants. Its amino acid sequence was deduced from a CDNA clone (T31478) derived from spinach leaves. The DE can be obtd. by recombinant expression in procaryotic or eucaryotic host cells. The DE may also be expressed in transgenic plants, e.g. potato. The consequent increase in DE activity results in the biosynthesis of modified starches by the plant. These may have food or industrial applns.
                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 1; Page 68-70;

This protein and the encoding nucleic acid fragments may be used to create transgenic plants in which corn pullulanase is present in cells at levels differing from the norm, or in cell types or developmental stages where it is not normally found, in order to alter starch structure in those cells. They may also be used to isolate cDNAs and genes encoding homologous pullulanase from the same or other plant species, to amplify those genes and to produce antibodies for screening of cDNA expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Zea

                            starch; sugar production; maltodextrin.
                                      Pullulanase; pulB; debranching enzyme; amylopectin; thermostable; genetically engineered variant; wheat; potato; wheat; manioc; rick starch; sugar production; high fructose syrup; high maitose syrup
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   transgenic plants in which the nucleic acid is stably integrated in host cell's genome and expressed. Such an enzyme can be used in the production of starch which is useful in the food industry or in the production of industrial products e.g. paper, adhesives, textiles, textile care products, building materials, soil stabilisers, agrochemicals, pharmaceutical products, cosmetics, coal briquettes, flocculants for ore and coal slurries, foundry sand binders, rubber
                                                                                                        Pullulanase (pulB)
                                                                                                                                         05-MAY-2000
                                                                                                                                                                                                     Y78513 standard; protein; 862
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         goods, leather substitutes and polymers.

The enzyme variants are useful for converting starch to one or more sugars. This is useful when starches such as corn, potato, wheat, manioc and rice starch are used as starting materials in commercial large scale production of sugars, such as high fructose syrup, high maltose syrup, maltodextrins, amylose, G4-G6 oligosaccharides and other carbohydrates such as fat replacers. The thermostable debranching enzymes of the invention make it possible to perform liquefaction and debranching simultaneously before the saccharification step. By debranching using the thermostable debranching enzyme variants during liquefaction together with the action of an alpha-amylase, the formation of panose precursors is reduced, thereby reducing the panose content in the final product and increasing the overall saccharification yield.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a pullulanase amino acid sequence. Pullulanases are debranching enzymes which can attack amylopectin. This sequence represents a parent enzyme from which genetically engineered variant debranching enzymes can be created. The genetically engineered enzyme has an improved thermostability at a pH in the range of 4-6 compared to the parent enzyme. The modified enzyme may alternatively or also have an increased activity towards amylopectin and or glycogen compared to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  13-JAN-2000

APC-9603. The present specification also describes: (1) a vector containing the DNA encoding a trimmed enzyme; (2) a recombinant microbe transformed by the DNA; and (3) preparation of a trimmed enzyme in which the microbe of (2) is cultured and the trimmed enzyme is collected from the culture. The method can prepare a trimmed enzyme of wide substrate specificity having heat resistance and being active in acid region efficiently.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

This sequence represents a pullulanase amino acid sequence. Pullulanases are debranching enzymes which can attack amy lopectin. This sequence represents a parent enzyme from which genetically engineered variant debranching enzymes can be created. The genetically engineered enzyme has an improved thermostability at a pH in the range of 4-6 compared to the parent enzyme. The modified enzyme may alternatively or also have an increased activity towards amylopectin and or glycogen compared to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pullulanase; debranching enzyme; amylopectin; thermostable; cugenetically engineered variant; wheat; potato; wheat; manioc; starch; sugar production; high fructose syrup; high maltose symaltodextrin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               parent enzyme. The enzyme variants are useful for converting starch to one or more sugars. This is useful when starches such as corn, potato, wheat, manioc and rice starch are used as starting materials in commercial large scale production of sugars, such as high fructose syrup, high maltose syrup, maltodextrins, amylose, 64-66 oligosaccharides and other carbohydrates such as fat replacers. The thermostable debranching enzymes of the invention make it possible to perform liquefaction and debranching simultaneously before the saccharification step. By debranching using the thermostable debranching enzyme variants during liquefaction together with the action of an alpha-amylase, the formation of panose precursors is reduced, thereby reducing the panose content in the final product and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

The pullulanse hydrolyses alpha-1,6-9,1ycosidic bonds of amylopectin and of pullulan. The enzyme can be used (with glucoamylase) for saccharification of starch. Typical applications include use as anti-staling additives in bread making and brewing, in preparation of low calorie foods and to clarify fruit juices.

```

The present sequence represents Bacillus deramificans strain T89.117D mature pullulanase (EC-3.2.1.41). This enzyme has $\mathfrak a$ 4.1-4.5, has a half-life of about 55 hr at 60 deg C and is $\mathfrak a$

s a pI capabl

Claim 31; Fig 1A-E; 49pp; English.

```
the recombinant pullulanase appears to be a result of misprocessing of the signal sequence by a signal peptidase as well as susceptibility to extracellular proteolytic processing. The invention provides modified pullulanases, especially N-terminally truncated B. deramificans modified pullulanase (see Y31747-48), nucleic acids encoding them, vectors, host cells and methods for recombinant production. The modified pullulanases are useful in the starch industry for the saccharification of aqueous liquefied starch, forming syrups of high glucose and maltose content. Other uses (not claimed) are: as anti-staling additives in bread; in brewing low calorie beers; production of low calorie foods (where amylose is used as substitute for fat); to clarify fruit juices; in the preparation of oligosaccharides from amylopectin or of tetraholosides from maltose; to condense mono- or oligosaccharides, or in the preparation altose; to condense mono- or oligosaccharides, starch saccharification, the modified pullulanases reduce the amounts of by-products, especially they provide higher glucose them the proparation times, without losses associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

When used for starch saccharification, the modified pullulanases reduce the amounts of by-products, especially they provide higher glucose yields in short reaction times, without losses associated with reversion reaction products. When used with glucoamylase, they make possible a higher level of dissolved solids in the material being treated, resulting in increased productivity and a more energy-efficient process.

Note: The present sequence is not shown in the specification but is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             vectors, host cells and methods for recombinant production. The modified pullulanases are useful in the starch industry for the saccharification of aqueous liquefied starch, forming syrups of high glucose and maltose content. Other uses (not claimed) are: as anti-staling additives in bread; in brewing low calorie beers; production of low calorie foods (where amylose is used as substitute for fat); to clarify fruit juices; in the preparation of cligosaccharides from amylopectin or of tetraholosides from maltose;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents an N-terminally truncated pullulanase of Bacillus deramificans strain T89.117D, comprising amino acids 103-928 of the native mature enzyme (see Y31746). The native mature pullulanase (EC-3.2.1.41) has a pI of 4.1-4.5, a half-life of about 55 hr at 60 deg C and is capable of catalysing the hydrolysis of alpha-1,6-glucosidic bonds in amylopectin and pullulan. The invention relates to the discovery that B.

                                                                                    당
                                                                                                                      ş
                                                                                                                                                                                                                                                                       The present sequence represents an N-terminally truncated CC pullulanase of Bacillus deramificans strain T89.117D, comprising CC amino acids 99-928 of the native mature enzyme (see v31746). The CC native mature pullulanase (EC-3.2.1.41) has a pI of 4.1-4.5. a half-life of about 55 hr at 60 deg C and is capable of catalysing CC the hydrolysis of alpha-1,6-glucosidic bonds in amylopectin and CC pullulan. The invention relates to the discovery that B. C deramificans pullulanase recombinantly produced in a Bacillus host CC is modified yet retains the ability to catalyse the hydrolysis of CC an alpha-1,6-glucosidic bond. The modification of the signal CC pullulanase appears to be a result of misprocessing of the signal CC sequence by a signal peptidase as well as susceptibility to extracellular proteolytic processing. The invention provides CC modified pullulanases, especially N-terminally truncated B. C deramificans modified pullulanase, nucleic acids encoding them, CC vectors, host cells and methods for recombinant production. The cC modified pullulanases are useful in the starch industry for the Saccharification of aqueous liquefied starch, forming syrups of CC saccharification of aqueous liquefied starch, forming syrups of CC saccharification of aqueous liquefied starch, forming syrups of CC saccharification of low calorie foods (where amylose is used as substitute CC for fat); to clarify fruit juices; in the preparation of condustry (no details). When used for starch saccharification, the CC modified pullulanases reduce the amounts of by-products, especially
                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                              industry (no details). When used for starch saccharification, the modified pullulanases reduce the amounts of by-products, especially they provide higher glucose yields in short reaction times, without losses associated with reversion reaction products. When used with glucoamylase, they make possible a higher level of dissolved solids in the material being treated, resulting in increased productivity and a more energy-efficient process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Misc-difference
                                                                                                                                                                                                                                                                       Sequence
